

THE SHORT-TERM IMPACT OF UNCONDITIONAL CASH TRANSFERS TO THE POOR: EXPERIMENTAL EVIDENCE FROM KENYA

Erratum

Johannes Haushofer*and Jeremy Shapiro†

April 22, 2017

Tables I and II in Haushofer and Shapiro (2016) erroneously calculated FWER-adjusted p-values using only 1,000 bootstrap iterations. The corrected tables report bootstrapped p-values with 10,000 iterations.

Table III in Haushofer and Shapiro (2016) reporting spillover results for summary indices erroneously weighted the index of psychological well-being with household and village weights. The corrected version removes village and household weights. Table III also erroneously omitted observations with missing outcome variables when calculating differential attrition rates for Lee treatment effect bounds. The corrected version includes the entire original sample. Table III reports slightly different standard errors for the Lee bounds from the original publication as a result of bootstrapping.

The corrected versions of Tables I, II, and III are included below as Tables **I**, **II**, and **III**, respectively. Text printed in **green** indicates changes due to increasing the corrected p-value bootstrap iterations to 10,000. Text printed in **red** indicates changes due to the removal of weights. Text printed in **orange** indicates changes due to the inclusion of the entire sample to calculate Lee bounds. Text printed in **blue** indicates changes due to pseudo-random results from bootstrap estimation.

Notes: OLS estimates of baseline differences in treatment arms. Outcome variables are listed on the left. For each outcome variable, we report the coefficients of interest and their standard errors in parentheses. FWER-corrected p -values are shown in brackets. Column (1) reports the mean and standard deviation of the control group for a given outcome variable. Column (2) reports the basic treatment effect, i.e. comparing treatment households to control households within villages. Column (3) reports the relative treatment effect of transferring to the female compared to the male; column (4) the relative effect of monthly compared to lump-sum transfers; and column (5) that of large compared to small transfers. The unit of observation is the household for all outcome variables except for the psychological variables index, where it is the individual. The sample is restricted to co-habiting couples for the female empowerment index and households with school-age children for the education index. The comparison of monthly to lump-sum transfers excludes large transfer recipient households, and that for male vs. female recipients excludes single-headed households. All columns include village-level fixed effects and cluster standard errors at the household level. The last row shows joint significance of the coefficients in the corresponding column from SUR estimation. * denotes significance at 10 pct., ** at 5 pct., and *** at 1 pct. level.

Table II: Treatment effects: Index variables

Notes: OLS estimates of treatment effects. Outcome variables are listed on the left. Higher values correspond to “positive” outcomes. For each outcome variable, we report the coefficients of interest and their standard errors in parentheses. FWER-corrected *p*-values are shown in brackets. Column (1) reports the mean and standard deviation of the spillover group, column (2) the basic treatment effect, i.e. comparing treatment households to control households within villages. Column (3) reports the relative treatment effect of transferring to the female compared to the male; column (4) the relative effect of monthly compared to lump-sum transfers; and column (5) that of large compared to small transfers. The unit of observation is the household for all outcome variables except for the psychological variables index, where it is the individual. The sample is restricted to co-habiting couples for the female empowerment index, and households with school-age children for the education index. The comparison of monthly to lump-sum transfers excludes large transfer recipient households, and that for male vs. female recipients excludes single-headed households. All columns include village-level fixed effects, control for baseline outcomes, and cluster standard errors at the household level. The last row shows joint significance of the coefficients in the corresponding column from SUR estimation. * denotes significance at 10 pct., ** at 5 pct., and *** at 1 pct. level.

Notes: OLS estimates of spillover effects. Outcome variables are listed on the left. The unit of observation is the household for all variables except psychological wellbeing, where it is the individual. The sample includes all households and individuals, except for the intrahousehold index, where it is restricted to co-habiting couples, and for the education index, where it is restricted to households with school-age children. Columns (1) and (2) report the “naïve” estimate of spillover effects, including spillover households that upgraded to metal roofs between baseline and endline. Column (3) and (4) report estimates of the spillover effect excluding metal-roof households. Columns (1) and (3) exclude baseline covariates. Columns (2) and (4) include baseline covariates. Column (5) reports the *p*-value of the equality for the coefficient estimates in (1) and (3) after joint estimation of the two models using SUR. Column (6) reports the *p*-value of the equality for the coefficient estimates in (2) and (4) after joint estimation of the two models using SUR. The last row reports *p*-values on the joint significance of all coefficients in a given column after joint estimation using SUR. Columns (7) and (8) report the lower and upper Lee bounds adjusting for differential “attrition” of five spillover households into metal-roof upgrade. Columns (9) and (10) report lower and upper Horowitz-Manski bounds, imputing outcomes for the five attriting households using the 95th and 5th percentiles of observed outcomes, respectively. The sample is restricted as in the previous tables. In columns (1) through (4), standard errors clustered at the village level are reported in parentheses. In columns (7) through (10), bootstrapped standard errors are reported in parentheses. * denotes significance at 10 pct., ** at 5 pct., and *** at 1 pct. level.
